

APS110 – Lecture 18

See hand written notes for drawings.

Exam Review

NaCl bond in rock salt = **ionic**

At absolute zero, only the lowest energy state would be occupied, therefore this is the best distribution of particles over possible energy states for a substance at 0K

Simple cubic has the lowest SPF (lower than BCC)

Property that is characteristic of a specific material and independent of sample size = **material property**

Coordination number of the interstitial site whose size is between tetrahedral and simple cubic
→ octahedral, therefore **CN = 6**

Tetrahedral: CN = 4

Cubic: CN = 8

Hooke's Law only applies if we're talking about the ELASTIC region (stress v. strain)
